

SpectraPass

Point-of-Use Material Authentication for Industrial MRO

Blaise Raman + uncertainty-aware AI + auditable material provenance

MATCH / MISMATCH / INCONCLUSIVE
explicit abstention when evidence is weak

CALL TO ACTION: Select SpectraPass to verify industrial materials before use - not after installation.

1 PROBLEM

Visually similar lubricants, adhesives, sealants, coatings and polymers can be mislabeled, substituted or counterfeit. Labels prove paperwork provenance, not the identity of the material in hand.

2 SOLUTION

Scan with Blaise, compare against a versioned approved-material library, and return **MATCH**, **MISMATCH** or **INCONCLUSIVE** with confidence, nearest-reference evidence, lot/device metadata and an audit record.

3 UNIQUENESS

Provenance-oriented AI instead of generic chemical naming: compact spectral retrieval, uncertainty calibration, drift checks, versioned references and explicit abstention when a scan is out of distribution.

4 IMPACT & SCALE

Start with industrial MRO and manufacturing teams that repeatedly verify incoming or point-of-use materials. Keep one reusable inference core while each organization controls its own libraries and SOPs.
